现代操作系统应用开发实验报告

学号: 15331418 **班级 :** 晚上班

姓名: 郑柏川 实验名称: Database & File Management

一.参考资料

参考的 ppt

二.实验步骤

a) 对 viewmodel 的设计

```
class TodoItemViewModel
{
    private NewObservableCollection<Models.TodoItem> allItems = new NewObservableCollection<Models.TodoItem> public NewObservableCollection<Models.TodoItem> AllItems { get { return this.allItems; } }

    private Models.TodoItem selectedItem = default(Models.TodoItem);
    public Models.TodoItem SelectedItem { get { return selectedItem; } set { this.selectedItem = value; } }

    private SQLiteConnection db;

    public TodoItemViewModel()...

public async void init()...
    public async Task

AddIodoItem(string title, string description, DateTimeOffset date, Uri imageUri)...

public async
    Task

UpdateTodoItem(long id, string title, string description, DateTimeOffset date, Uri imageUri, bool completed)...

public string FindTodiItem(string query)...

private bool ItemMatch(TodoItem item, string query)...

private bool ItemMatch(TodoItem item, string query)...

}
```

细节,以init为例子:

```
class TodoItemViewModel
{
    private NewObservableCollection(Models.TodoItem) allItems = new NewObservableCollection(Models.TodoItem) public NewObservableCollection(Models.TodoItem) allItems { get { return this.allItems; } }

    private Models.TodoItem selectedItem = default(Models.TodoItem);
    public Models.TodoItem SelectedItem { get { return selectedItem; } set { this.selectedItem = value; } }

    private SQLiteConnection db;

    public async void init()...
    public async Task
    ##AddTodoItem(string title, string description, DateTimeOffset date, Uri imageUri)...

    public async
    Task
    ##UpdateTodoItem(long id, string title, string description, DateTimeOffset date, Uri imageUri, bool completed)...

// 查
    public string FindTodiItem(string query)...

private bool ItemMatch(TodoItem item, string query)...
}
```

b) Mainpage 对增删改查 采取在 itemlist 上的增删改查并实现数据库的同步:

(以一个函数为例子):

```
//检查正确
//如果选中了
if (ViewModel.SelectedItem != null)
    Uri uri = (image_grid.Source as BitmapImage).UriSource;
    await ViewModel. UpdateTodoItem(ViewModel. SelectedItem.getid(), title_grid.Text, description_
    ViewMode1. SelectedItem = null;
    title_grid.Text = "'
    description_grid.Text = "";
    date_grid.Date = DateTime.Now;
    image_grid.Source = new BitmapImage(new Uri("ms-appx:/Assets/background.jpg"));
    UpdateButton.Content = "Creat";
    DeleteButton.Content = "Cance1":
e1se
    Uri uri = (image_grid.Source as BitmapImage).UriSource;
    await ViewModel. AddTodoItem(title_grid. Text, description_grid. Text, date_grid. Date, uri);
    title_grid. Text = "";
    description_grid.Text = "";
    date_grid. Date = DateTime. Now;
    image_grid.Source = new BitmapImage(new Uri("ms-appx:/Assets/background.jpg"));
```

c) 搜索框的实现

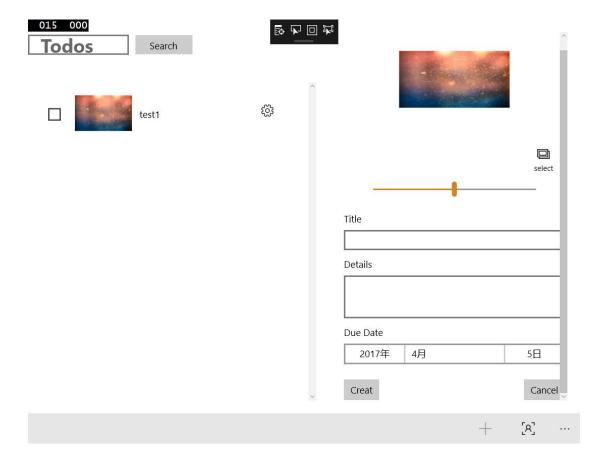

```
<TextBox x:Name="SearchContent" Grid.Column="0" Height="30" X/TextBox>

<Button x:Name="SearchButton" Grid.Column="1" Height="30" Content="Search" Click="SearchButton_Click" Margin="10, 0, 20, 0"

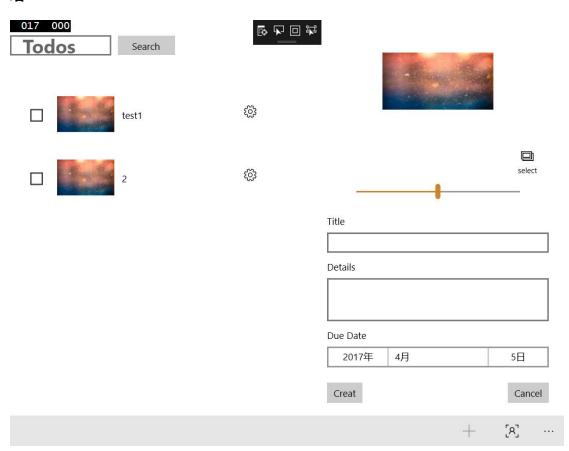

private void SearchButton_Click(object sender, RoutedEventArgs e)
{
    string query = SearchContent.Text;
    if (query == "")
    {
        var message = new MessageDialog("请输入查询内容", "Search Error").ShowAsync();
        return;
    }

    string result = ViewModel.FindTodiItem(query);
    if (result == "") result = "未找到";
    var message2 = new MessageDialog(result, "Search Result").ShowAsync();
}
</pre>
```

三. 实验结果截图

增:

四. 实验过程遇到的问题

异步问题:

C#的代码不像之前写的 js ,是可以直接等到异步的 ,一开始代码老是跑不起来 ,

后来在调用异步函数前加上 await 即可

图片问题:

首先是 uri 与 source 的互转,查阅相关文档发现可以直接转化

其次是存取,利用 StorageFile.GetFileFromApplicationUriAsync 方法

五.思考与总结

多次接触数据库,这次也没什么变化,主要是前端在数据变化时要添加数据库的更新
