现代操作系统应用开发实验报告

姓名: 郑柏川 实验名称:多媒体应用

一.参考资料

参考的 ppt

二.实验步骤

跟着 ppt 一步一步来,很快就做出来了

```
private void open(object sender, RoutedEventArgs e)
{
    timelineSlider.Maximum = myMedia.NaturalDuration.TimeSpan.TotalSeconds;
}

private void end(object sender, RoutedEventArgs e)
{
    myMedia.Stop();
}

private void ChangeMeidaVolume(object sender, RangeBaseValueChangedEventArgs e)
{
    if (myMedia != null)
    {
        myMedia.Volume = (double)volumnSlider.Value;
    }
}

//經放
private void PlayC(object sender, RoutedEventArgs e)
{
    myMedia.Play();
```

```
private void ChangeMeidaVolume(object sender, RangeBaseValueChangedEventArgs e)
{
    if (myMedia != null)
    {
        myMedia. Volume = (double) volumnSlider. Value;
    }
}
//播放
private void PlayC(object sender, RoutedEventArgs e)
{
    myMedia. Play();
}
//哲傳
private void PauseC(object sender, RoutedEventArgs e)
{
    myMedia. Pause();
}
//停止
private void StopC(object sender, RoutedEventArgs e)
{
    myMedia. Stop();
}
```

这些函数都可以直接调用现有的 api

下图是全屏

```
//全屏
private void FullScreen(object sender, RoutedEventArgs e)
{
    ApplicationView view = ApplicationView.GetForCurrentView bool isInFullScreenMode = view.IsFullScreenMode;
    if (isInFullScreenMode)
    {
        myMedia.IsFullWindow = !myMedia.IsFullWindow;
        view.ExitFullScreenMode();
    }
    else
    {
        myMedia.IsFullWindow = !myMedia.IsFullWindow;
        view.TryEnterFullScreenMode();
    }
}
```

选择文件

```
private Task OpenFile()
var open = new FileOpenPicker();
open.FileTypeFilter.Add(".wma");
open.FileTypeFilter.Add(".wmv");
open.FileTypeFilter.Add(".mp3");
open.FileTypeFilter.Add(".mp4");
var file = await open.PickSingleFileAsync();
if (file != null)
    string type = file.FileType;
    IRandomAccessStream stream = await file.OpenAsync(FileAccessMode.Read);
if (type == ".wma" || type == ".mp3")
        myMedia. Visibility = Visibility. Collapsed;
         cover. Visibility = Visibility. Visible;
         myMedia. SetSource(stream, file. ContentType);
         myMedia.Play();
    else if (type == ".mp4" || type == ".wmv")
        myMedia.Visibility = Visibility.Visible;
         cover. Visibility = Visibility. Collapsed;
        myMedia. SetSource(stream, file. ContentType);
        myMedia.Play();
         await new MessageDialog("不支持该文件格式"). ShowAsync();
```

三. 实验结果截图

刚开始长这样

002 000

四. 实验过程遇到的问题

封面转动问题:

刚开始毫无头绪,然后经提醒果断用了时间与角度的转化,很快就实现了

选择文件:

直接用了选择图片的 api

五. 思考与总结

感觉是各种基础 api 的调用就可以基本成型了

但是要实现进阶的很难,例如切换音轨(一开始总是蛋疼的中文配音),以及隐藏后自动暂停问题 根本不从下手
